Attitude Survey *- Practical work two*

Author: Michael Johansson & Peter Danielsson

Supervisor: Ola Flygt

Semester: VT 2016

Subject: 1DV700

1 The attitude against backuping files

Keeping a backup of valuable files becomes more and more important. Malwareprogrammers creates more ransomware trojans because they know that people and companies dont backup their files. Ransomware is when a trojan gets in to the system and encrypt the drive or files and demands money to decrypt it. If people just have backups on their files they can just use the backup instead of paying of the perpetrator.

Our main purpose we would like to investigate is how common backuping is by the public. We check the age in our survey to see if there any behaviour patterns between the age groups.

We will use Google forms to create the questionnaire and send it to our friends and family.

2 Questions

Exemple questions for our survey.

1. What is your age?
2. Do you know what a filebackup is?
3. Do you backup your files?
4. Have you lost important files due to no existing backups?
5. How do you store your backups?
6. How often?
7. Have you had to use a backup?

3 Hypothesis

We think that the age groups between 18-35 will be the largest in if they backup, and largest in the question have lost important files due to non existing backups. We also think that the group 50+ will have the least yes on the question do you backup.
